

BESS OFFSHORE PETROLEUM

OFFSHORE FLOATING OIL AND GAS REFINARY

A floating production, storage and offloading (FPSO) unit is a floating vessel used by the offshore oil and gas industry for the processing of hydrocarbons and for storage of oil.

The vessel is designed to receive hydrocarbons produced from nearby platforms or subsea template, process them, and store oil until it can be offloaded onto a tanker or, less frequently, transported through a pipeline.

FPSOs are preferred in frontier offshore regions as they are easy to install, and do not require a local pipeline infrastructure to export oil.

The beauty of the floating production, storage and offloading (FPSO) unit, is that it can be steered from field to field whenever necessary .

The Best Opportunity in oil and gas off the Atlantic shores of Africa.

Invest in the world's largest developing marketplace.

With France no longer simply concentrating on its former colonies and Francophone Africa, but expanding its markets to other regions. Regime changes in these countries will be creating a huge opportunity in oil and gas production. New leaders will look to their natural resources to boost their economic and social development.

Despite a current lack of production, what creates one of the most exciting opportunities for growth in the global energy landscape over the next few years appears to be the coast of Africa

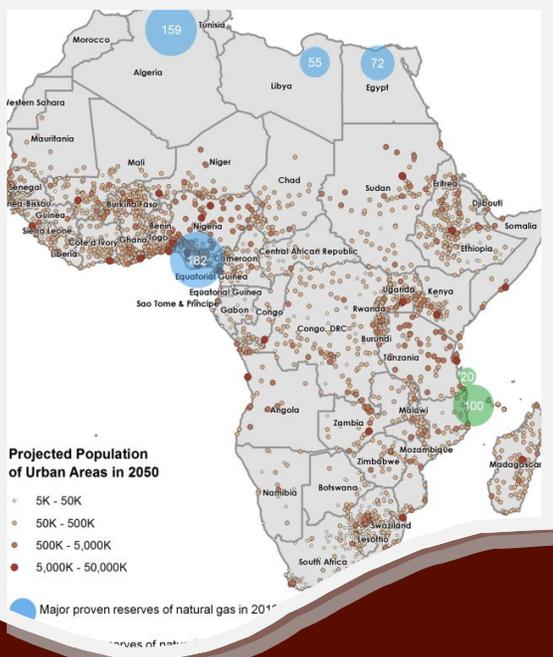

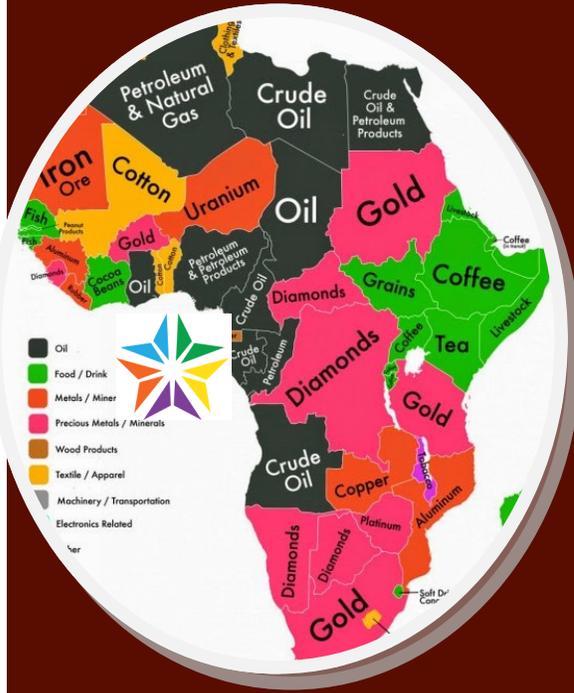

These Countries has the opportunity to use oil and gas discoveries to boost their economic and social development. Low-cost energy and feedstock sources have the potential to give these Countries the same cost advantages in manufacturing enjoyed by other hydrocarbon-rich nations. In the short term, such sources also could alleviate the shortfall in electricity generation and facilitate development of renewable energy sources.

To capitalize on these opportunities, Bess Offshore Petroleum must position itself to support the development of gas and oil as a low-cost energy source and a feedstock source for chemicals beneficiation, as we can streamline the process of offshore field development and refining through the use of our high-quality and versatile FPSOs, with flexible modularized production systems optimized to meet a wide range of production requirements.

With their aging assets, refiners and retailers are at some risk from new developments. These Countries will find it difficult to compete with new large-scale, efficient refining facilities, whether LNG or crude oil-based. Their best bet will be to first explore options for partnerships in emerging and renovate environmental technologies Such as with Bess Offshore Petroleum to exploit gas supplies. Secondly, that should help them concentrate on maximizing the performance of their legacy assets.

Our Chemical productions have the most to win from the exploitation of oil and gas in these regions. With a looming worldwide oversupply of chemical capacity, only regions with a source of local, low-cost feedstock will stay competitive. African coastal gas and oil offers that opportunity, and Bess Offshore Petroleum is to position itself to take advantage of this opportunities.
